

Various improvements to subject identification

- Matching against address definitions has been optimised
- Addresses from countries without a postcode system are now recognised more reliably

Various bug fixes and improvements, such as

- Improved display of long organisation names in the left-hand navigation sidebar
- Minor optimisations for Members with admin rights for groups or seals
- Minor improvements to actions for “Responsible Users or Groups” on shared boxes
- Fixed an issue, where submitting a deletion request for a strongly verified account was not always possible
- Improvements to section management
- Fixed an issue, where deleting service users did not work in all cases
- Fixed an issue, where support users could not create new organisations in some cases
- SSO: Fixed an issue, where renaming the IDP group ID was not possible
- Changes to navigation when switching organisations: the current navigation level is retained when switching organisations, provided the user also has access to that level
- General improvements to the display of long folder names
- Organisation and box invitations are now marked as expired in DeepAdmin: resending an invitation makes it valid again for seven days

Various bug fixes and improvements, such as

- Improved action toolbar
- Optimised preview for .txt files
- Fixed an issue where editing .txt files could lead to an error
- Minor improvements to the open invoice notifications on the DeepBox dashboard

Various bug fixes and improvements, such as

- Fixed an issue where seal annotations could be misplaced in some cases
- Improved handling of unsupported Mobile ID authentication methods
- Improved error handling during signing

Announcement of a technical change: New default signature level for documents and files created after 1 September 2026

From 1 September 2026, PAdES-baseline-LT will be used instead of PAdES-baseline-T with embedded revocation information.

Handling of annotated files

More precise information is provided when a document contains changes, for example due to annotations being created, modified or deleted after the signature was applied.

Various bug fixes and improvements, such as

- Updated to Spring Boot 4.1
- Support for validating additional signature types, such as Advanced Seals in accordance with eIDAS
